OUTLINE

PART I

- **Motivation**
- **Case presentation**
- **Methodology**
 - *Tools and Data*
 - *Experiments*
- **Results**
- **Conclusions**

PART II

- **Future Work**

PART I

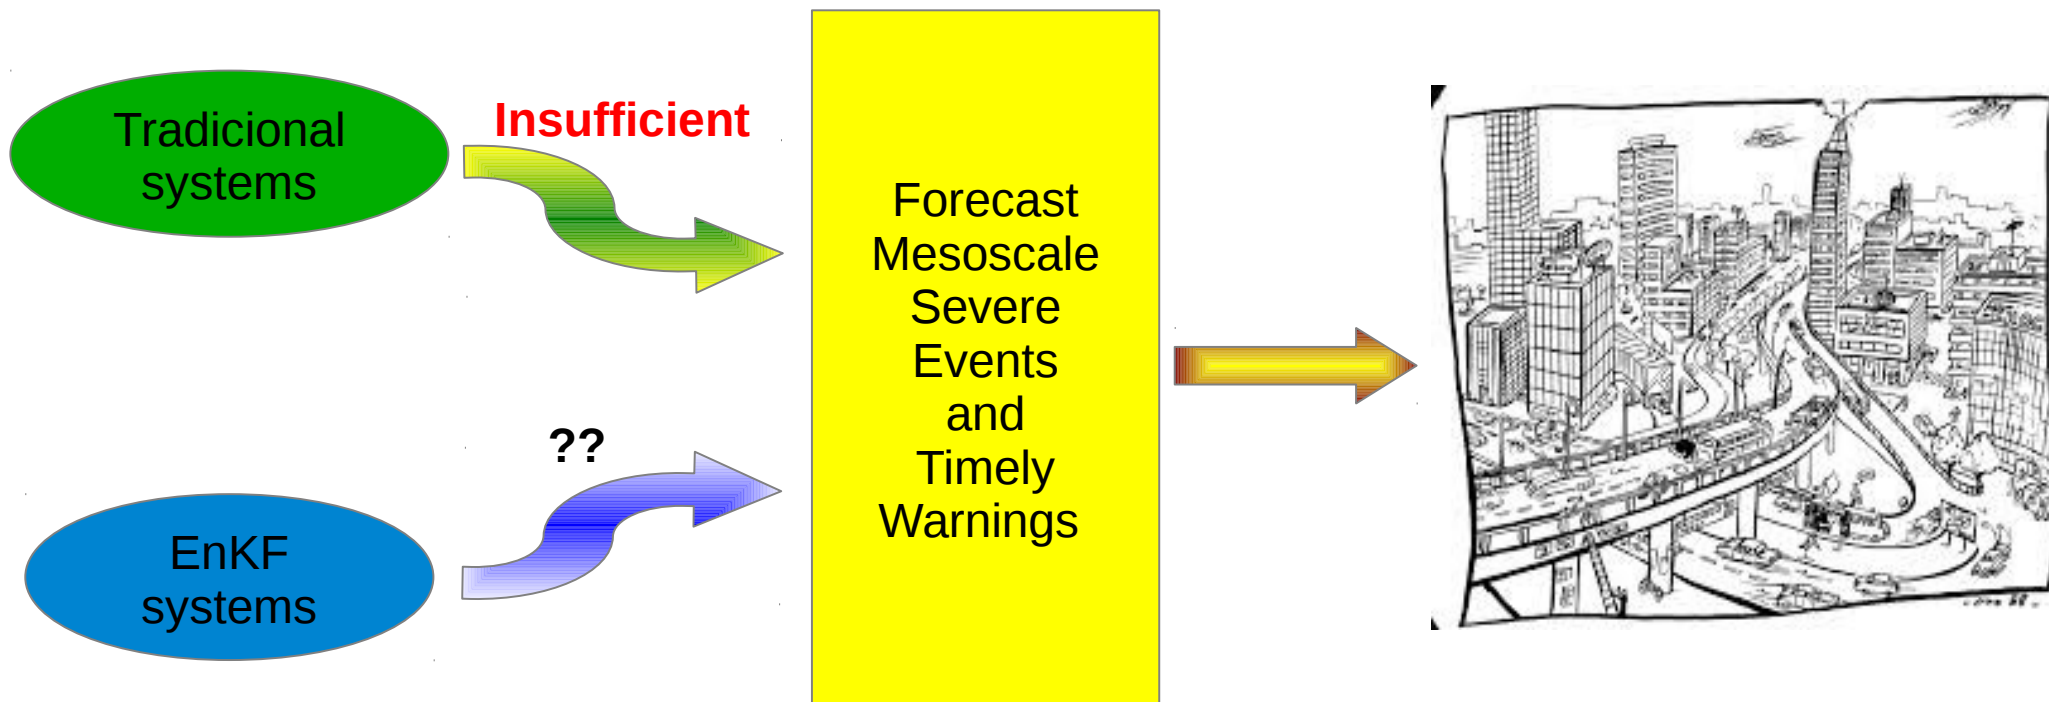

MOTIVATION

- Current operational forecasts still ***fail*** to predict severe mesoscale events
- Improve mesoscale forecasts to be able to enhance warning systems (***mitigation***)
- Investigate the skill of a mesoscale ensemble data assimilation (***EnKF***)
- Predict various aspects of the ***squall line*** occurred on 4th October 2007
- Compare EnKF performance against straightforward downscaling strategies

MOTIVATION

- Current operational forecasts still **fail** to predict severe mesoscale events
- Improve mesoscale forecasts to be able to enhance warning systems (**mitigation**)
- Investigate the skill of a mesoscale ensemble data assimilation (**EnKF**)
- Predict various aspects of the **squall line** occurred on 4th October 2007
- Compare EnKF performance against straightforward downscaling strategies

CASE PRESENTATION

- Location of Mallorca:

Area most
Affected by
Squall Line

CASE PRESENTATION

- Severe weather event during the afternoon on **October 4th of 2007** in Palma de Mallorca:

CASE PRESENTATION

- Severe weather event during the afternoon on **October 4th of 2007** in Palma de Mallorca:

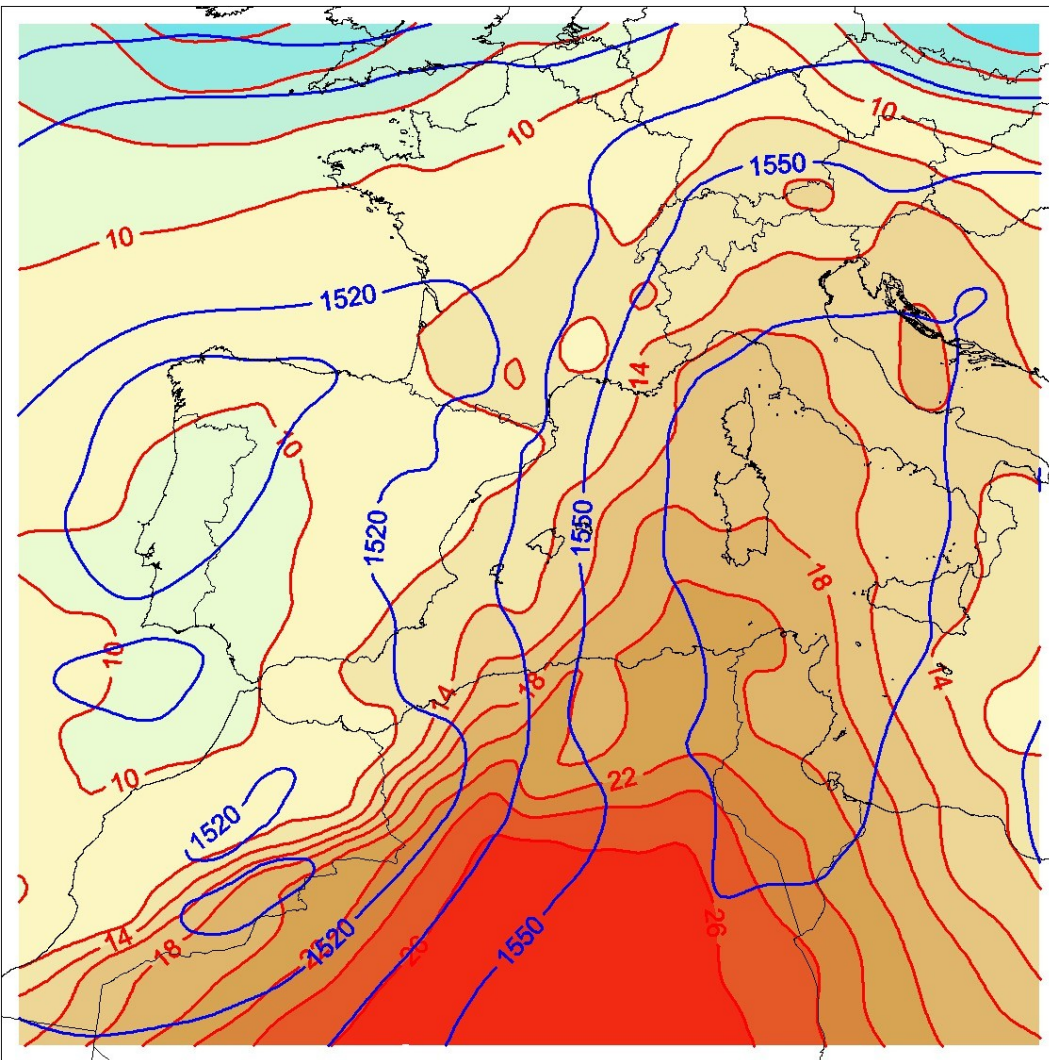

- **One person killed** and huge damage to property in the industrial area estimated at **10 M €**

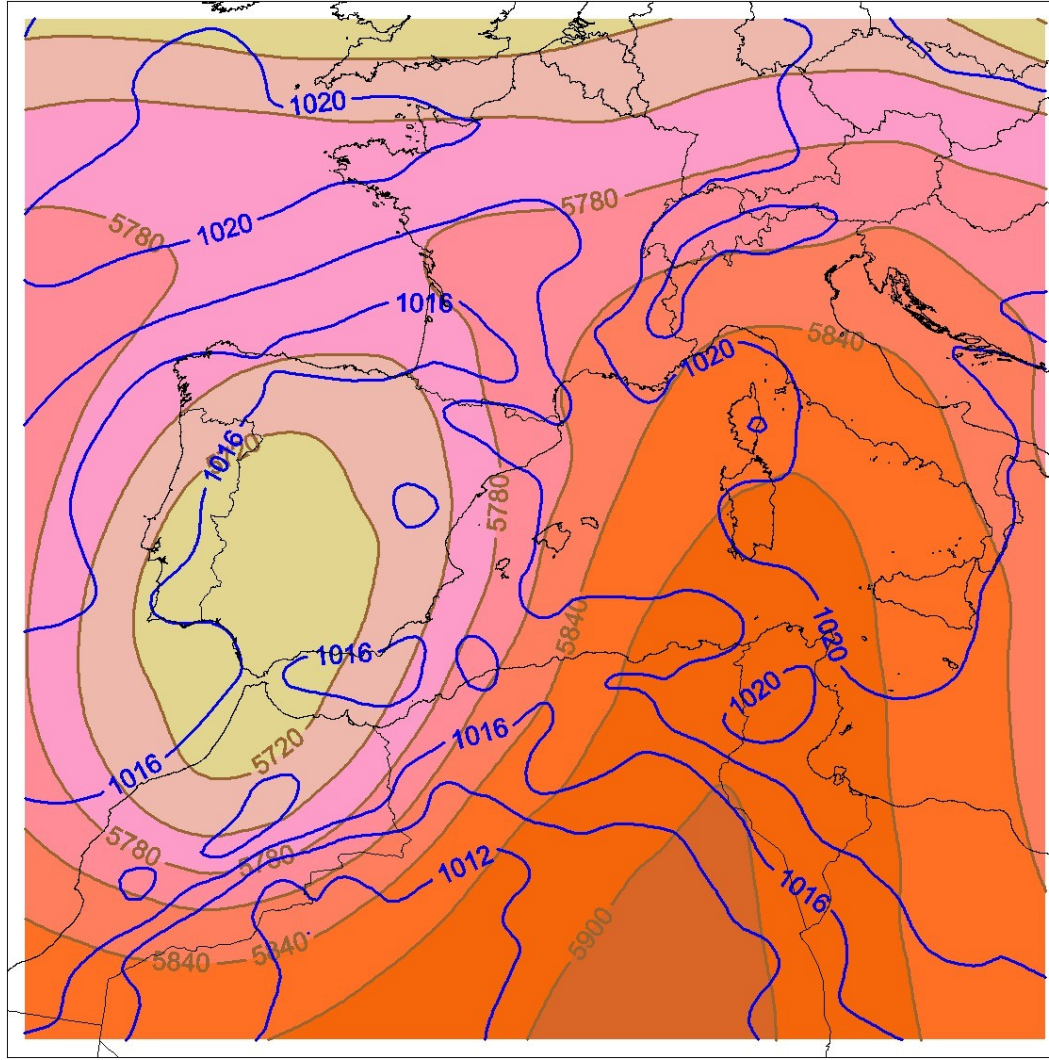

CASE PRESENTATION

- Meteorological synoptic situation from ECMWF (*) on 4 October 2007 at 00:00 UTC

**850 hPa geopotential height (blue contours)
and temperature (colour filled contours)**

**500 hPa geopotential height (colour filled contours)
and sea level pressure (blue contours)**

(*) ECMWF: European Center for Medium-Range Weather Forecasts

A decorative horizontal line with a wavy, undulating pattern, transitioning from a dark blue on the left to a lighter blue on the right.

- Squall line organization, initiated in the morning offshore Murcia

- Ensemble Kalman Filter (EnKF), used by DART (Data Assimilation Research Testbed) software.

METHODOLOGY

A) TOOLS AND DATA

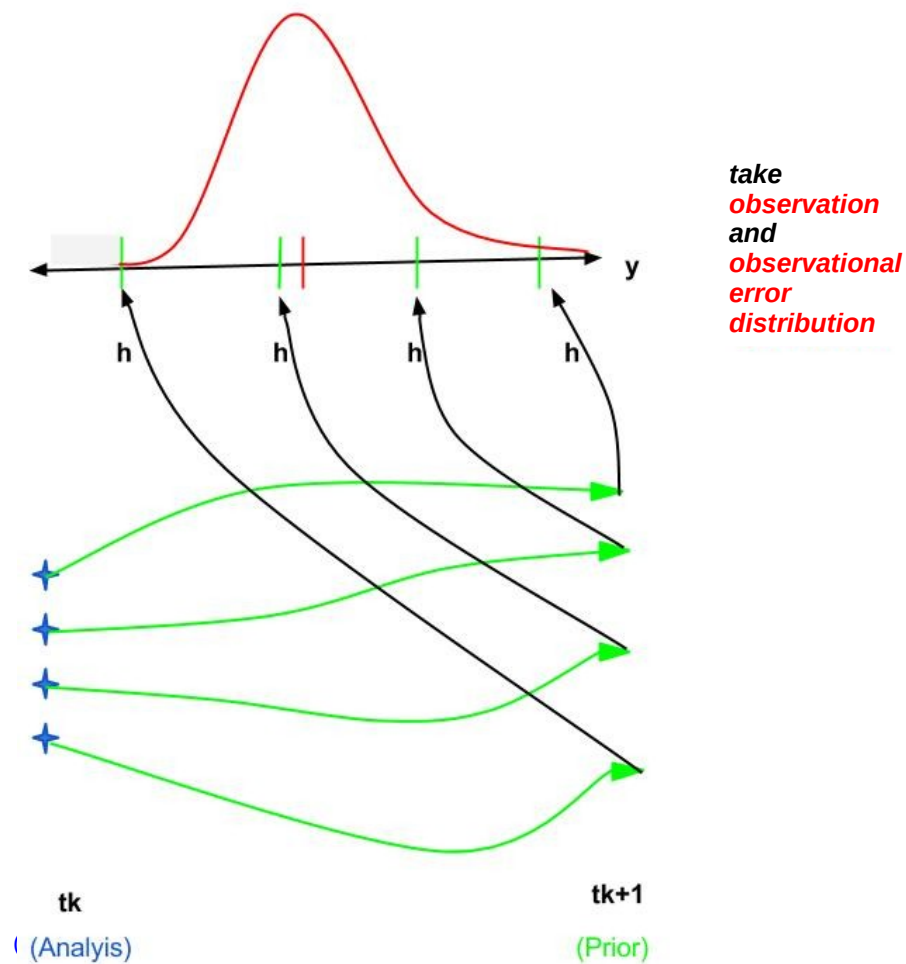

- Ensemble Kalman Filter (EnKF), used by DART (Data Assimilation Research Testbed) software.

METHODOLOGY

A) TOOLS AND DATA

- Ensemble Kalman Filter (EnKF), used by DART (Data Assimilation Research Testbed) software.

METHODOLOGY

A) TOOLS AND DATA

- Characteristics of the EnKF

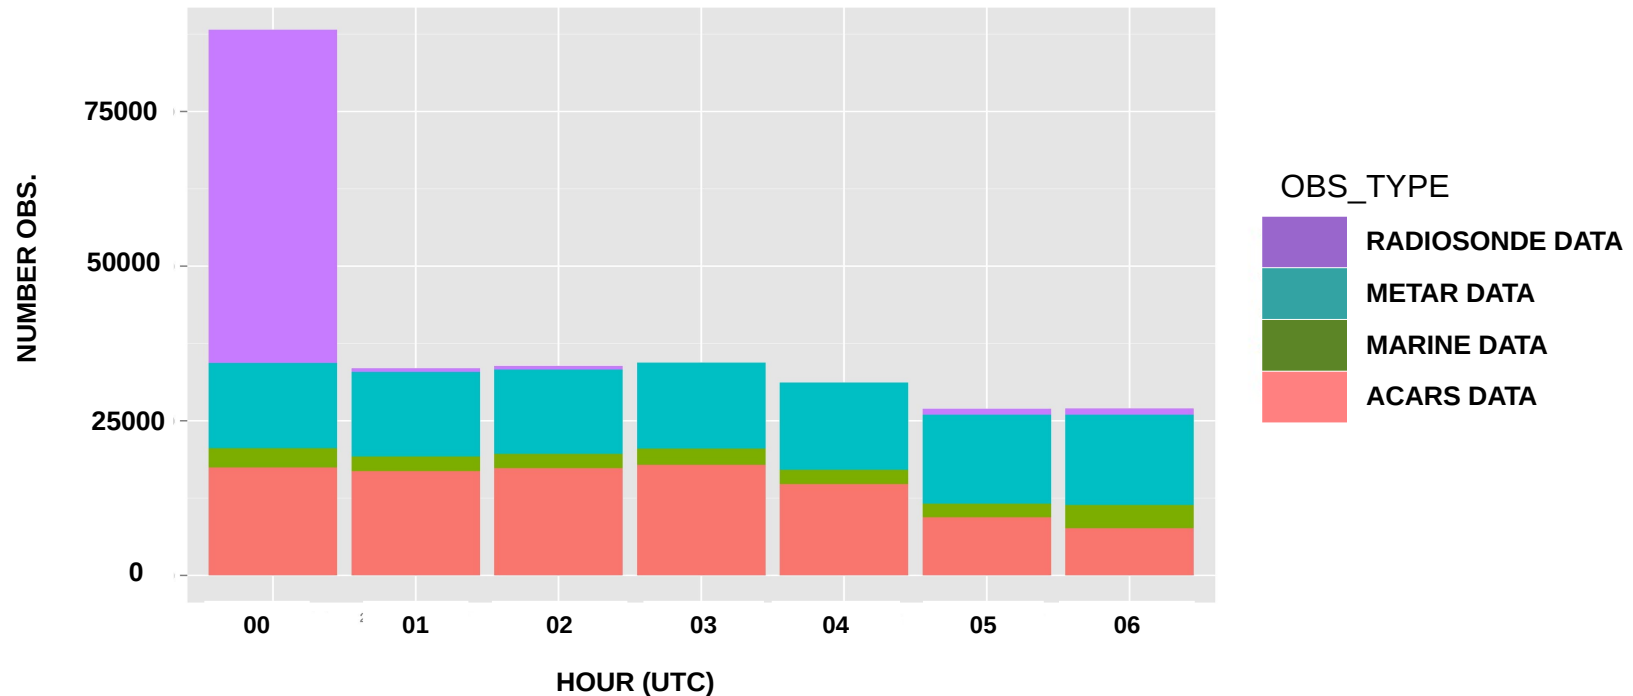

Members of Ensemble: 24

Boundary and Initial Conditions from EPS ECMWF (3h)

1h assimilation cycle with in-situ observations from MADIS

- Data assimilated from MADIS (Meteorological Assimilation Data Ingest System) source

Number and type of observations provided to the EnKF assimilation system (4 Oct 2007 00-06 UTC)

METHODOLOGY

A) TOOLS AND DATA

- WRF-ARW (Weather Research and Forecast) model V.3.4: Fully compressible, non-hydrostatic model

Domain: 138x93 grid points

$\Delta t = 60s$

$\Delta x = 16km$

Vertical levels=50

Number members of ensemble=24

Initial/Boundary Conditions provided by ECMWF EPS

Wester Mediterranean Domain Configuration

- Multiphysic configurations: 24 members with 4 PBL schemes, 3 prescribed concentrations of cloud condensation nuclei and 2 cumulus schemes:

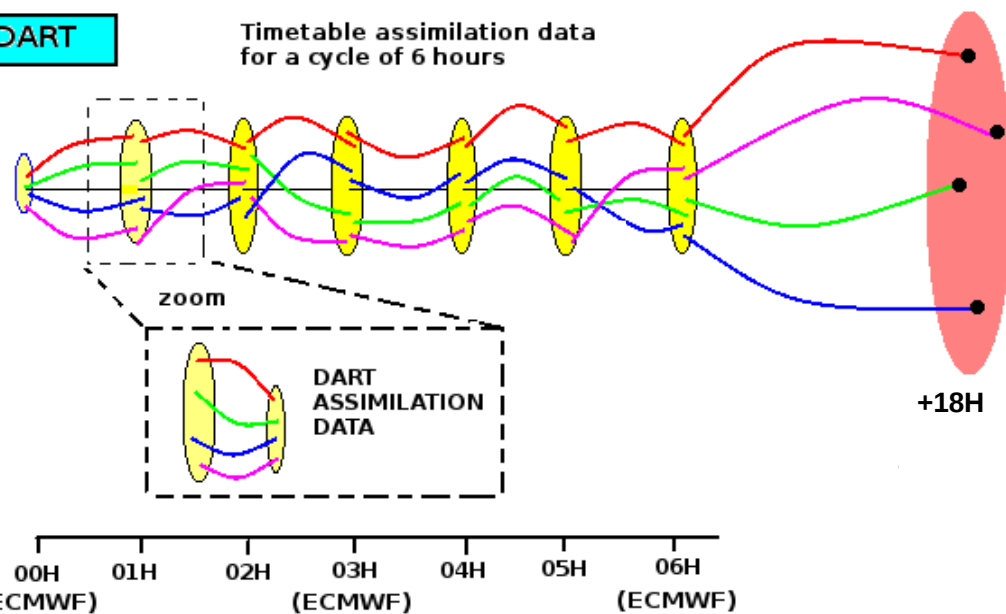

PBL	YSU	MYJ	ACM2	MYNN2
CCN	1,5E9	1,0E9	0,5E9	
Cumuls	Kain-Fritsch	New Simplified Arakawa-Schubert		

METHODOLOGY

B) EXPERIMENTS

DART

Timetable assimilation data
for a cycle of 6 hours

RESULTS

Products:

- CAPE + CIN mean
- CAPE + CIN maximum
- **Divergence and convective activity**
- Probability of Severe Weather (PoS)

DART:

Divergence (s^{-1}) and max. reflectivity (dBz)

Best Initiation (memb:17)

Evolution event (memb:17)

EC DS 00:

Divergence (s^{-1}) and max. reflectivity (dBz)

Best Initiation (memb:1)

Evolution event (memb:1)

EC DS 06:

Divergence (s^{-1}) and max. reflectivity (dBz)

Best Initiation (memb:24)

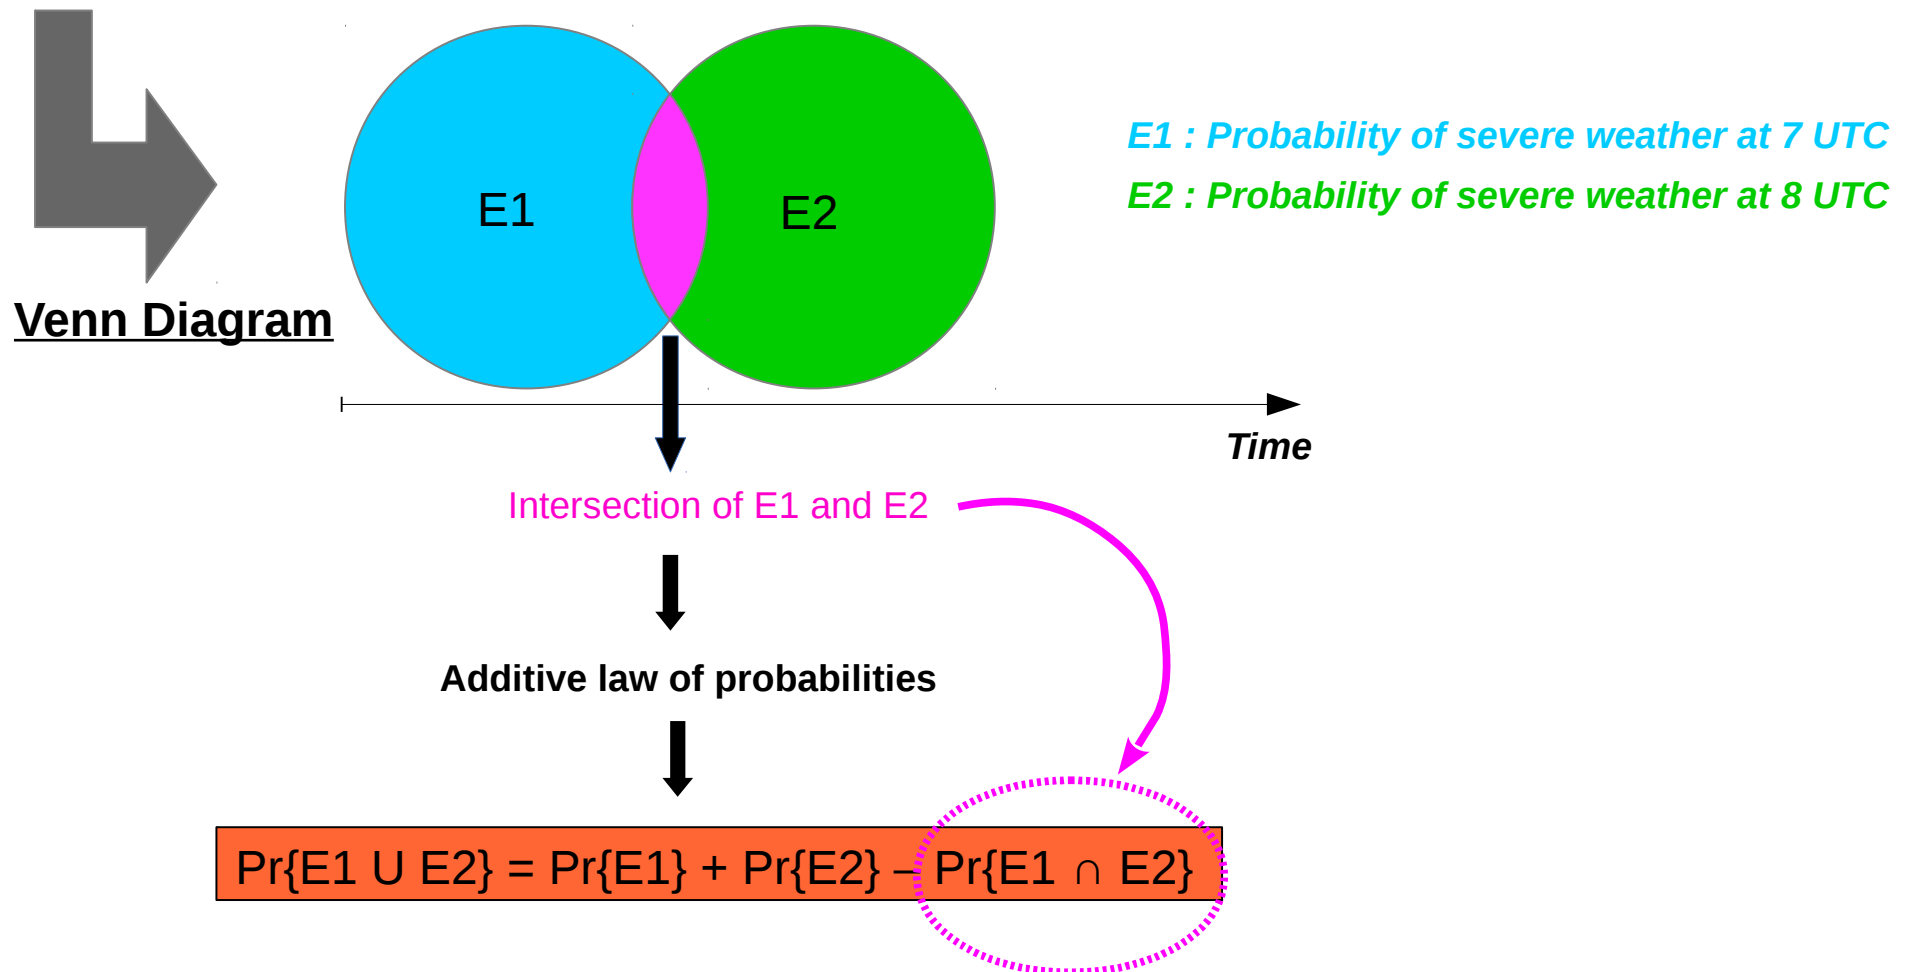

Evolution event (memb:24)

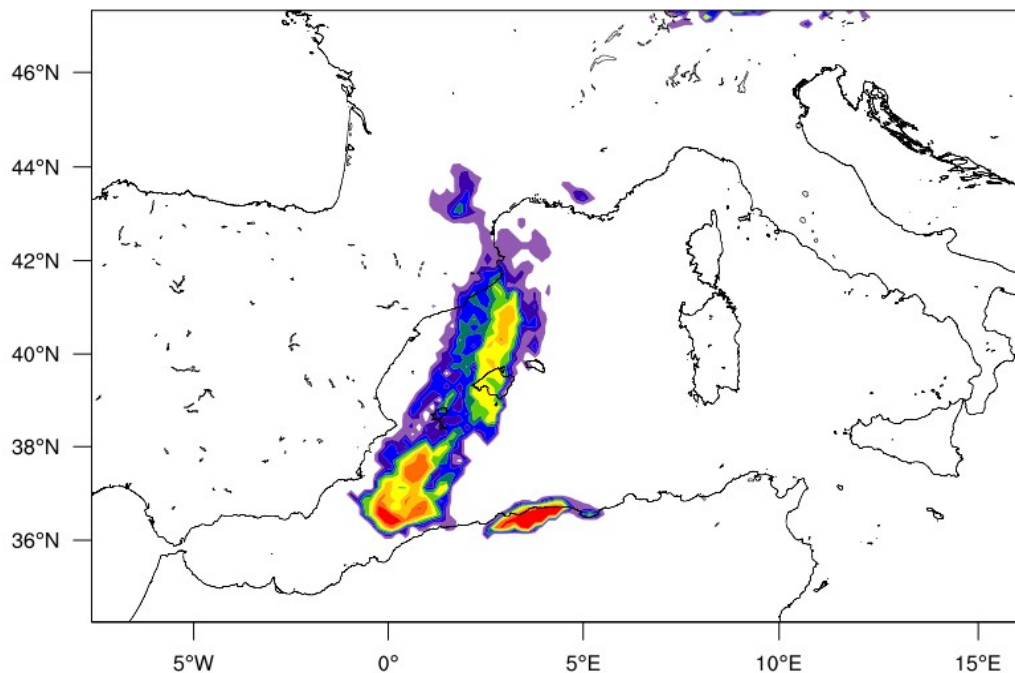

RESULTS

Products:

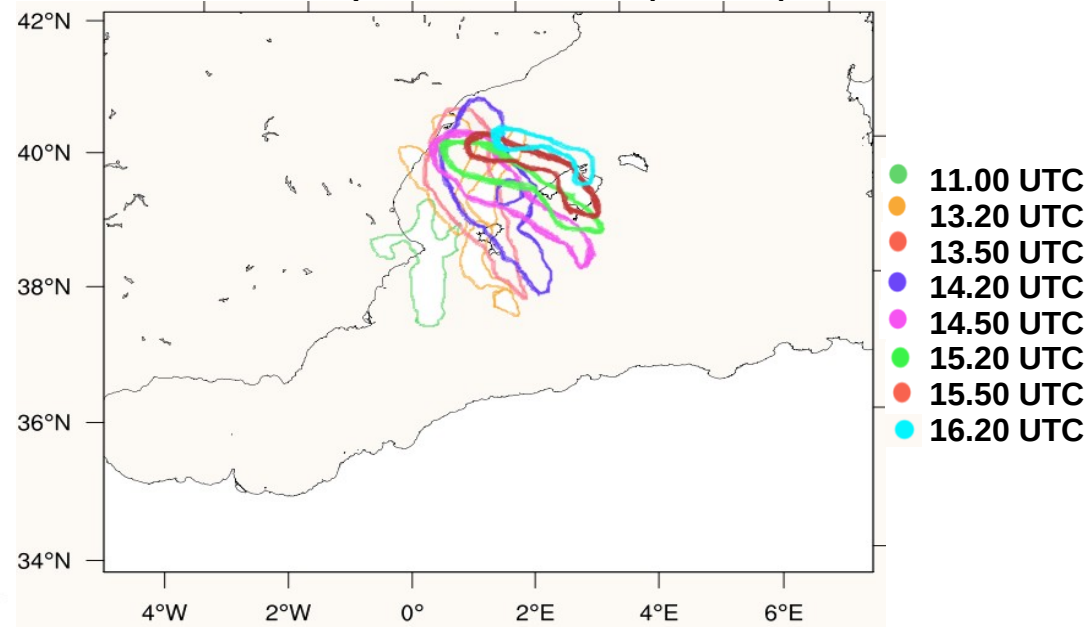

- CAPE + CIN mean
- CAPE + CIN maximum
- Divergence and convective activity
- **Probability of Severe Weather (PoS)**

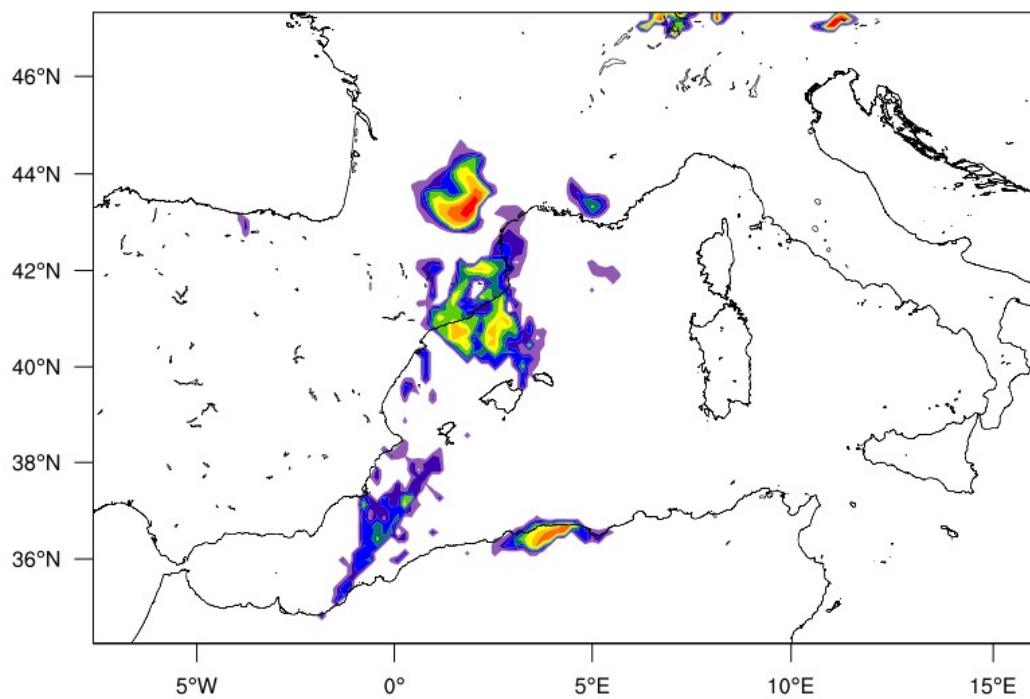

PoS DART (mm>30 , km/h>80) 4 Oct 2007 (07-18)UTC

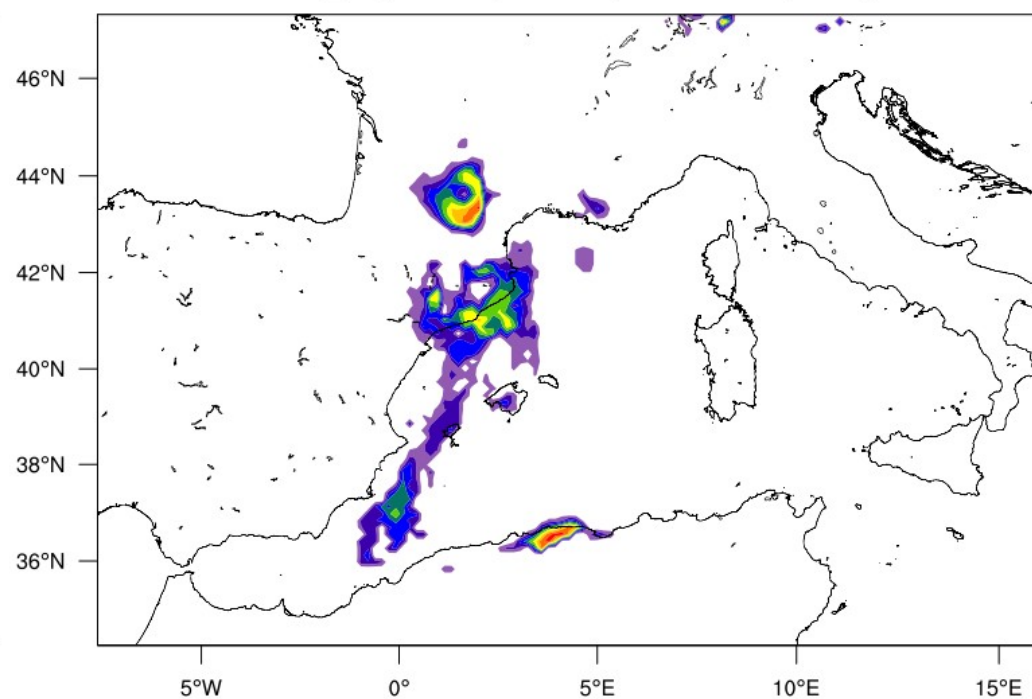

Reflectivity radar observations (>30dBz)

PoS ECD_00 (mm>30 , km/h>80) 4 Oct 2007 (07-18)UTC

PoS ECD_06 (mm>30 , km/h>80) 4 Oct 2007 (07-18)UTC

Probability (%)

CONCLUSIONS

- ◆ DART EnKF has shown large potential of these forecasting systems in advecting observational information from land sites toward data-void areas over the sea
- ◆ Improved representation of the mesoscale environment in which the system initiated and evolved which a more realistic distribution of CAPE and CIN values
- ◆ Better representation of the mesoscale environment leads to a superior quantification of the potential for severe derived from the EnKF than those derived by direct downscaling of ECMWF EPS forecast.

PART II

FUTURE WORK

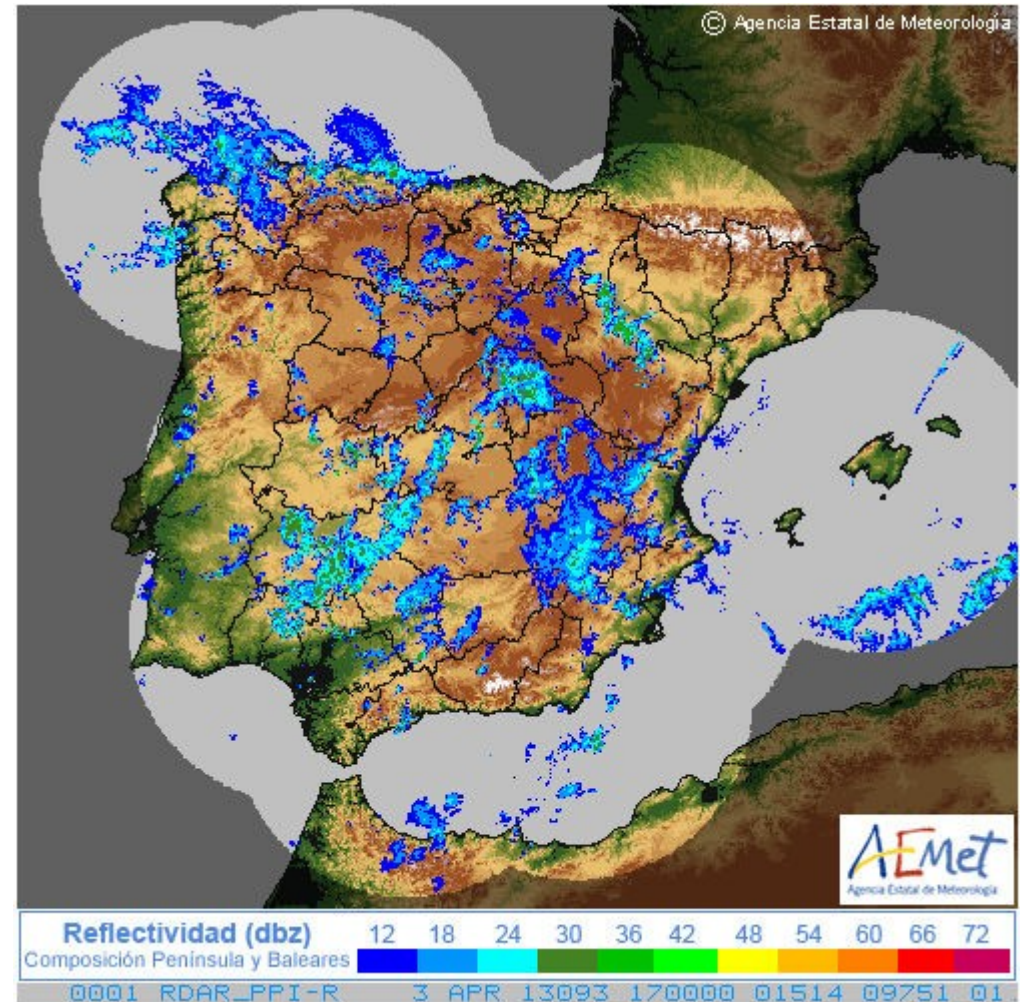

- Improve the assimilation over the Western Mediterranean which contains too few in-situ observations (most of the area is Sea), using data from remote sensing instruments:

➤ Satellite Data Assimilation

FUTURE WORK

➤ Radar Data Assimilation

FUTURE WORK

➤ Other Experimental Assimilation of Experimental Observations

Lidar (terrestrial)

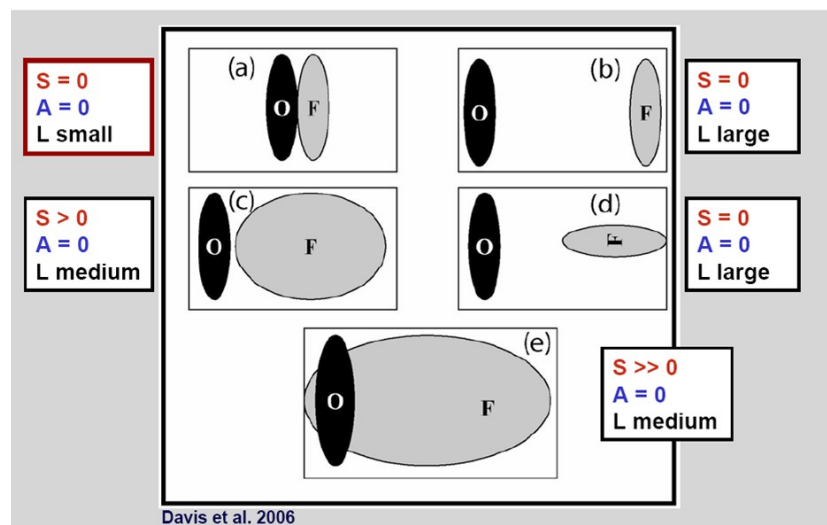

Constant-height balloons

Sodar

FUTURE WORK

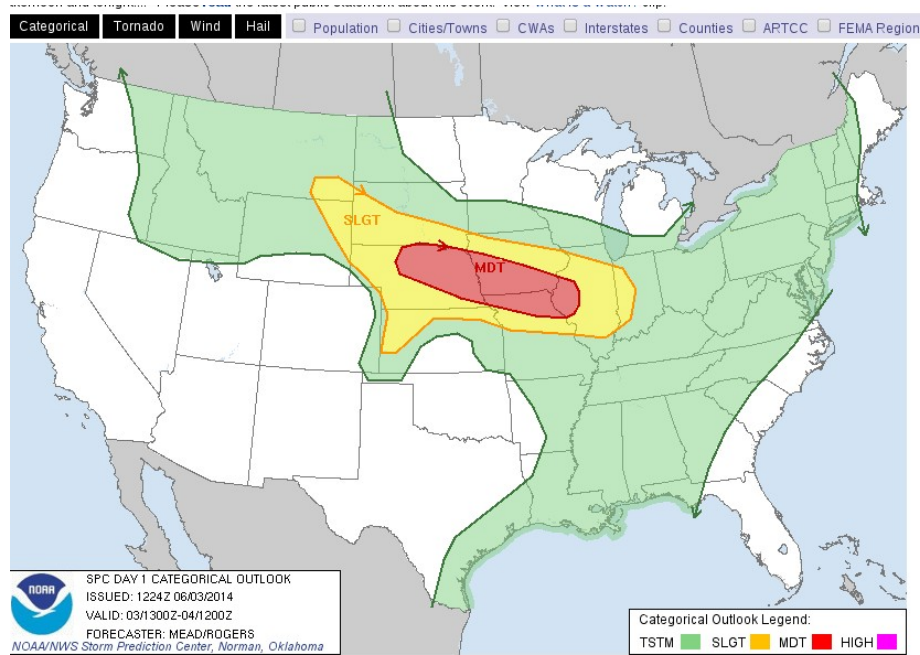

- Kilometric and Sub-Kilometric space resolution, to explore the prediction of convective modes (linear, scattered, MCS)
- What is the predictability limit of high impact phenomena?
- Post-Process: What kind of tools we can use to take maximum advantage of the model's output information? (maximum updraft helicity or severity index, ...)
- Verification:
 - Index Verification: Frequency Bias, Brier Skill, Equitable Threat Score, Attributes Diagram,...
 - Get useful information of our fields predicted: SAL (Structure Amplitude and Location), MODE (Method for Object-Based Diagnostic Evaluation)

SAL method

FUTURE WORK

➤ Convective Outlooks: Automatic generation of warnings

Convective Outlook

➤ Reproduce and design synthetic prediction fields, highly informative and easy to interpret directly for use in statal-regional weather services from Western Mediterranean region.
